

(54) Title: CONTAINER

[Illustration]

(57) Abstract (from German Copy): The invention relates to a container with a bottom shell (1) and a cover shell (2), and means for interlocking the cover shell with the bottom shell. It is proposed that the substantially circular opening rim (3) of the bottom shell have at least two first sections (6, 6", 6", 6'') provided with radial extension and each having at least one undercut (4, 4', 4", 4''), that the cover shell (1) have at its opening rim (3') at least two second sections (7, 7', 7", 7'') corresponding to the first sections as far as the radial extension is concerned, that the second sections (7, 7', 7", 7'') each have at least one undercut (5, 5', 5", 5'') which corresponds to the undercut of the appertaining first section (6, 6", 6", 6'') so that, during a rotation of bottom shell (1) relative to cover shell (2), interlocking takes place in the area of the undercuts of the first and the second appertaining sections.
